

Arc Treasury

Infrastructure layer for on-chain US
Treasury yield

USDC yield from T-Bills. Built on Circle's L1. Live on
testnet.

Prepared for DCVC — December 2025

The Infrastructure Problem

\$270B in stablecoins with broken plumbing

Stablecoins represent the largest crypto use case, yet the infrastructure to make them productive is fragmented and inefficient.

Current State	Problem
DeFi lending	Variable rates, smart contract risk, complex UX
TradFi rails	Slow settlement, limited access, no crypto interop
Cross-chain	Fragmented liquidity, bridge security risks

Result: Billions in idle USDC earning 0% while T-Bills yield 4%+

The Solution

Unified yield infrastructure on Circle's own L1

Layer	Function	Tech
Yield Layer	USDC → T-Bill yield via USYC	Hashnote integration
Bridge Layer	Cross-chain settlement	Circle CCTP V2
Liquidity Layer	Stablecoin AMM	USDC/EURC pool

Single protocol. Native USDC. Institutional-grade backing.

USYC = Hashnote's tokenized US Treasury fund. Issued by Circle International, backed by short-term T-Bills (~4% APY). Instant USDC redemption 24/7.

Why This Matters for Infrastructure

Circle's Arc = new financial rails

Arc L1 Advantage	Infrastructure Benefit
Native USDC issuance	No bridge risk, direct Circle backing
CCTP V2 protocol	Atomic cross-chain, no wrapped tokens
Enterprise SLA	Institutional uptime guarantees
First L1 by stablecoin issuer	\$60B USDC, \$110B+ CCTP volume

Building core infrastructure on Circle's strategic blockchain = aligned incentives

Technical Architecture

Production-ready stack

User → Arc Treasury Frontend

Smart Contracts (11 deployed)

Circle Infrastructure
(USDC, CCTP, Arc L1)

Traction — First Month Live

Organic adoption, zero marketing spend

Metric	Value	Note
Transactions	1,269	30 days
Volume	\$31M+	Testnet USDC
Active wallets	162	Organic only
Bridge operations	400+	Cross-chain
Points earned	290K+	User engagement

"The project is too early for direct investment from our side but we'll keep a very close eye out as you continue to scale."

— **David Shamash, Circle Ventures** (Dec 2025)

Business Model

Infrastructure fees at scale

Revenue Stream	Fee	At \$100M TVL
Yield management fee	5% of yield	\$200K/year
Bridge settlement fees	0.06%	\$1.4M/year
Swap liquidity fees	0.2%	\$1M/year
Total ARR		\$2.6M/year

Unit economics improve with scale — fixed infrastructure costs, variable revenue

Market Opportunity

Intersection of two massive trends

Market	Size	Growth
Stablecoins	\$273B	→ \$1.5T by 2030
Tokenized Treasuries	\$1B+ TVL	Fastest growing RWA
CCTP volume	\$110B+	Circle's bridge

Arc Treasury = infrastructure play at the intersection

First mover on Circle's own L1 = defensible position

Competitive Landscape

Infrastructure differentiation

Protocol	Approach	Our Advantage
Ondo (\$600M)	Multi-chain, complex	Arc-native, simpler
Mountain	Single product	Full stack
Aave/Compound	Lending	Stable T-Bill yield

Why hard to replicate:

- First Arc-native = preferred ecosystem partner
- Vertical integration (yield + bridge + swap)
- Direct Circle infrastructure relationship

Team

Technical founders, execution focus

Anton — Founder & Lead Developer	Robert — Co-founder & Operations
Full-stack blockchain (5+ years)	COO at BonusBlock
11 contracts, full frontend — solo build	Injective, Xion, Axelar, Theorix
Base Batches 002, Zama FHE Track	BD & partnerships across L1/L2

Lean team. Ship fast. Technical depth.

Investment Terms

Seed Round

Parameter	Value
Target	\$1,000,000
Minimum	\$600K
Token allocation	15-20%
FDV	\$5-6M
Instrument	SAFT
Vesting	6-month cliff, 18-month linear
Previous capital	\$0 (bootstrapped)

Infrastructure pricing — product risk, not market risk

Use of Funds

\$1M deployment

Category	Allocation	Purpose
Security Audit	\$150K (15%)	Trail of Bits / OpenZeppelin
USYC Integration	\$100K (10%)	Institutional onboarding
Engineering	\$250K (25%)	6 hires Y1
Legal & Entity	\$80K (8%)	Georgia LLC, compliance
Marketing	\$150K (15%)	Developer relations
Operations	\$120K (12%)	Infrastructure costs
Contingency	\$150K (15%)	Buffer

Roadmap

Path to mainnet and scale

Timeline	Milestone
Q1 2026	Seed close, entity setup
Q2 2026	Security audit, USYC institutional
Q3 2026	Mainnet launch on Arc
Q4 2026	\$5-15M TVL target
2027	Multi-chain expansion via CCTP
Q4 2027	Token launch (TGE)

DCVC Fit

Why this aligns with your thesis

DCVC Focus	Arc Treasury
Deep tech infrastructure	Core financial rails for stablecoins
Data-driven	On-chain analytics, transparent TVL
Computational approaches	Smart contract automation of T-Bill yield
Trillion-dollar problems	\$270B idle stablecoin capital

You've backed blockchain infrastructure before — this is the yield layer for Circle's ecosystem.

Why Invest Now?

1. **Working infrastructure** — not a whitepaper
 2. **First mover on Arc** — Circle's strategic L1
 3. **Real yield source** — US T-Bills, not token inflation
 4. **Conservative entry** — \$5-6M FDV, 20-40x potential
 5. **Technical team** — ship fast, deep blockchain expertise
- Early infrastructure bet on Circle's ecosystem expansion.**

Let's Talk

We're building yield infrastructure for Circle's L1
